

Algebra 2R

Problem List 1

Weronika Jakimowicz

EXERCISE 1.

Proof that $\mathbb{C} = \mathbb{R}[z]$ for every complex number $z \in \mathbb{C} \setminus \mathbb{R}$.

To begin with, let us take any $z \in \mathbb{C} \setminus \mathbb{R}$ such that $z = ai$ for some $a \in \mathbb{R}$. We have that

$$\mathbb{R}[z] = \{f(z) : f \in \mathbb{R}[X]\}.$$

Let $I = (X^2 + a^2) \triangleleft \mathbb{R}[X]$ be an ideal of $\mathbb{R}[X]$ generated by a polynomial with no real roots. We know that $\mathbb{R}[X]/I \cong \mathbb{C}$.

This is because \mathbb{R} is a field and so $\mathbb{R}[X]$ is an euclidean domain: if we take any $f \in \mathbb{R}[X]$ then we can write it as $f = v(X^2 + a^2) + w$, where w is of degree 0 or 1 ($< \deg(X^2 + a^2)$) and so f in $\mathbb{R}[X]/I$ is represented only by w . Now it is quite easy to map polynomials with real coefficients and maximal degree 1 to \mathbb{C} , for example $f : \mathbb{R}[X]/I \rightarrow \mathbb{C}$ such that $f(aX + b) = ai + b$. Therefore $\mathbb{R}[X]/I \cong \mathbb{C}$.

Consider the evaluation homomorphism ϕ_z which maps $\mathbb{R}[X] \ni w \mapsto w(z) \in \mathbb{R}[z]$. We can see that $\ker(\phi_z) = (X^2 + a^2) = I$. Therefore, by the fundamental theorem on ring homomorphism we have an isomorphism

$$f : \text{Im}(\phi_z) = \mathbb{R}[z] \rightarrow \mathbb{R}[X]/\ker(\phi_z) = \mathbb{R}[X]/I$$

and as mentioned above, $\mathbb{R}[X]/I \cong \mathbb{C}$. Hence, $\mathbb{R}[z] \cong \mathbb{C}$.

EXERCISE 2.

Assume that $K \subset L$ are fields and $a, b \in L$. For a rational function $f(X) \in K(X)$ define $f(a)$ as $\frac{g(a)}{h(a)}$, where $g, h \in K[X]$, $f = \frac{g}{h}$ and $h(a) \neq 0$, provided such g, h exist. If not, $f(a)$ is undetermined. Prove that

(a) if $f(X) \in K(X)$ and $f(a)$ is defined, then $f(a)$ is determined uniquely (does not depend on the choice of g, h)

Suppose by contradiction that $f(a)$ depends on which g, h we choose. That means that there exist $g, h, g', h' \in K[X]$, $h(a) \neq 0$, $h'(a) \neq 0$ such that $f = \frac{g}{h} = \frac{g'}{h'}$ but $\frac{g(a)}{h(a)} + c = \frac{g'(a)}{h'(a)}$, where $c \in L \setminus \{0\}$.

From $f = \frac{g}{h} = \frac{g'}{h'}$ we get that $g \cdot h' = g' \cdot h$ and in particular

$$(gh')(a) = (g'h)(a)$$

$$g(a)h'(a) = g'(a)h(a)$$

$$g(a)h'(a) - g'(a)h(a) = 0$$

From the assumption that $f(a)$ depends on the choice of polynomials we get that

$$\begin{aligned}\frac{g'(a)}{h'(a)} &= \frac{g(a)}{h(a)} + c \\ g'(a)h(a) &= g(a)h'(a) + ch'(a) \\ g'(a)h(a) - g(a)h'(a) &= ch'(a) \neq 0\end{aligned}$$

Which is a contradiction because $c \neq 0$, $h'(a) \neq 0$ and we have no zero divisors.

(b) $K(a) = \{f(a) : f \in K(X) \text{ and } f(a) \text{ is defined}\}$

We know that $K(a)$ is a subfield of L that is generated by $K \cup \{a\}$. Let us label this field as L' . We will show that $L' = K(a)$.

$$L' \subseteq K(a)$$

Let us take any $x \in L'$. Then x is a finite linear combination of elements from K and $\{a \cdot a^{-1}\}$:

$$x = \sum_{0 \leq k \leq n} \alpha_k a^{i_k k}, \quad i_k \in \{1, -1\}, \quad \alpha_k \in K.$$

We need to change this into a rational function. Take $p_k \in K[X]$ such that $p_k(X) = \alpha_k X^k$. We have that

$$x = \sum_{0 \leq k \leq n} p_k(a^{i_k}).$$

It is clear that when working with rational functions we may say that $p_k(a^{-1}) = \frac{1}{p'_k(a)}$ where $p_k(X) = \alpha_k^{-1} X^k$.

$$x = \sum_{0 \leq k \leq n} p_k(a^{i_k}) = \frac{\sum_{0 \leq k \leq n} p_k(a) \prod_{\substack{0 \leq l \leq n, \\ i_l = -1}} p'_k(a)}{\prod_{\substack{0 \leq k \leq n, \\ i_k = -1}} p'_k(a)} \in K(a)$$

$$K(a) \subseteq L'$$

Let us take any $f \in K(X)$ such that $f(a)$ is defined. We may write $f = \frac{g}{h}$ for $g, h \in K[X]$ and $h(a) \neq 0$. We have that $g(a) \in L'$ and $h(a) \in L'$. Therefore, $\frac{g(a)}{h(a)} = g(a) \cdot [h(a)]^{-1} \in L'$.

(c) $K(a, b) = (K(a))(b)$

Let

$$I_{ab} = I((a, b)/K[x, y])$$

$$I_a = I(a/(K[y])[x])$$

$$I_b = I(b/(K(a))(y))$$

and j_a, j_b, j_{ab} are quotient functions defined as below. We know that $\ker(j_a) = I_a$, $\ker(j_b) = I_b$ and $\ker(j_{ab}) = I_{ab}$. Let ϕ_a be an evaluation function that substitutes only one variable:

$$\phi_a : K(x, y) \rightarrow (K(a))(y)$$

$$\phi_a(f(x, y)) = f(a, y)$$

that is ϕ_a returns a rational function with changed coefficients. ϕ_b, ϕ_{ab} are defined as evaluation functions without such modifications.

Function ψ is a ring homomorphism defined as composition of ϕ_a and ϕ_b :

$$\psi : K(x, y) \rightarrow (K(a))(y)$$

$$\psi = \phi_b \circ \phi_a$$

For f to be an isomorphism

$$f : (K(a))(b) \rightarrow K(a, b)$$

we need to show that $\ker(\phi_{ab}) = \ker(\psi)$ because then

$$\begin{array}{ccc} & K(x, y)/\ker(\phi_{ab}) = K(x, y)/\ker(\psi) & \\ \cong \swarrow & & \searrow \cong \\ K(a, b) & \xleftarrow{\quad \cong \quad} & (K(a))(b) \end{array}$$

$$\ker(\phi_{ab}) = \ker(\psi)$$

$$\subseteq$$

$f \in \ker(\phi_{ab})$ means that $f(a, b) = 0$. That is, either of the following is true for any $x, y \in K$

$f(a, b) = 0$ this directly implies that $f \in \ker(\psi)$.

$f(a, y) = 0$ the same as above.

$f(x, b) = 0$ we know that for any $x \in K$ $f(x, b) = 0$ then for $x = a$ this is also true and so $f(a, b) = 0$ and $f \in \ker(\psi)$.

$$\supseteq$$

$f \in \ker(\psi)$ means that $f(a, b) = 0$ or $f(a, y) = 0$. This means that $f \in \ker(\phi_{ab})$.

Therefore, there exists an isomorphism $K(a, b) \cong (K(a))(b)$.

EXERCISE 3.

Assume that $K \subseteq L$ are fields and $f_1, \dots, f_m \in K[X_1, \dots, X_n]$ have degree 1.

(a) Prove that if the system of equations $f_1 = \dots = f_m = 0$ has a solution in L then it has a solution in K . (hint: use linear algebra).

Let

$$f_i = \sum_{1 \leq k \leq n} b_{i,k} X_k$$

for $i = 1, \dots, m$.

We are working on linear equations, therefore we can construct a matrix that stores the same information as the system of equations $f_1 = \dots = f_m$. Let

$$f_i = \sum_{1 \leq k \leq n} b_{i,k} X_k$$

for $i = 1, \dots, m$. The matrix representation of this system of equations is:

$$\begin{bmatrix} b_{1,1} & b_{1,2} & b_{1,3} & \dots & b_{1,n-1} & b_{1,n} \\ b_{2,1} & b_{2,2} & b_{2,3} & \dots & b_{2,n-1} & b_{2,n} \\ \dots & \dots & \dots & \dots & \dots & \dots \\ b_{m,1} & b_{m,2} & b_{m,3} & \dots & b_{m,n-1} & b_{m,n} \end{bmatrix} X = 0.$$

Using Gaussian algorithm, we can create an upper triangular matrix with coefficients from K . The solution would be found by backwards substitution. That is, a_n would be in the bottom right corner of the matrix and it is an element of K because such are the coefficients within my matrix. Then a_{n-1} would be a combination of a_n with two elements of K , hence it would still be in K and so on. Each a_i would be a linear combination of elements from K and a_k , $k < i$, which we know are in K .

(b) Does K contain a generic solution of this system (over K)?

From Remark 1.4. we know that \bar{a} is a generic solution \iff for any other solution $\bar{a}' \in K^n$ we have only one homomorphism $h : K[\bar{a}] \rightarrow K[\bar{a}']$ such that $h(\bar{a}) = \bar{a}'$ and $h|_K = \text{id}_K$. It is suffice to notice that because $K[\bar{a}]$ and $K[\bar{a}']$ are evaluations of polynomials with coefficients from K , then they are finite combinations of elements from K and therefore $K[\bar{a}] \subseteq K$ and $K[\bar{a}'] \subseteq K$. Therefore $h \subseteq \text{id}_K$ and thus is unique.

ZADANIE 5.

Which of the following solutions of the equation $X_1^2 - X_2^3 = 0$ in the field of rational functions $\mathbb{C}(X)$ are generic over the field \mathbb{Q} ?

(a) $(1, 1)$

Ok, so a solution is generic if $\{g \in K[X] : g(a) = 0\} = (f_1, \dots, f_m)$. So maybe I should look for all polynomials that $g(1, 1) = 0$

$$(x - 1), (y - 1)$$

And it is quite difficult to make a linear polynomial from a polynomial of order 3.

$$(\sqrt[6]{8}, \sqrt[6]{4})$$

$$(x^6 - 8) = (x^2 - 2)(x^4 + 2x^2 + 4)$$

$$(y^6 - 4) = (y^3 - 2)(y^3 + 2)$$

So the

$$I(\bar{a}/K = \mathbb{Q}) = ((x^2 - 2), (y^3 - 2))?$$

Suppose that $((x^2 - 2), (y^3 - 2)) = ((x^2 - y^3))$. Then we would have that for some $p, q \in \mathbb{Q}[X]$

$$\begin{cases} x^2 - 2 = p(x^2 - y^3) \\ y^3 - 2 = q(x^2 - y^3) \end{cases}$$

But like, p cannot reduce the degree of y and q cannot reduce the degree of x so this is absurd.

$$(1, \cos \frac{2}{3}\pi + i \sin \frac{2}{3}\pi)$$

Osz to jest w zespo.

ZADANIE 6.

Assume that $f \in K[X]$ is irreducible, $\deg(f) = n > 0$, $\text{char}(K) = 0$ and L is the splitting field of polynomial f over K . Prove that the field L has at least n distinct automorphisms.

First of all, I need f to have n distinct roots in L .

If a is at least a double root of f then $f'(a) = 0$. Let

$$f(x) = \alpha_n x^n + \alpha_{n-1} x^{n-1} + \dots + \alpha_1 x + \alpha_0$$

where $\alpha_n \neq 0$. Then, the derivative is

$$f'(x) = n\alpha_n x^{n-1} + (n-1)\alpha_{n-1} x^{n-2} + \dots + \alpha_1$$

and because we $\text{char}(K) = 0$, then $n\alpha_n = \alpha_n + \dots + \alpha_n \neq 0$. Thus, $f'(x) \neq 0$.

We know that $f \in K[X]$ is irreducible and f' has lower degree, hence f' does not divide f . From Bezout's identity I get that there exist $p, q \in K[X] \setminus \{0\}$ such that

$$fp + f'q = 1.$$

If $f'(a) = 0$, then

$$0 = f(a)p(a) + f'(a)q(a) = 1$$

which is a contradiction, hence $f'(a) \neq 0$ and f has only simple roots.

Let $\phi \in \text{Aut}(L)$ such that $\phi|_K = \text{id}_K$. Let $a_1, \dots, a_n \in L$ be roots of f . Then for $i = 1, \dots, n$ we have

$$\begin{aligned} 0 &= \phi(f(a_i)) = \phi\left(\sum_{k=0}^n \alpha_k a_i^k\right) = \sum_{k=0}^n \phi(\alpha_k a_i^k) = \\ &= \sum_{k=0}^n \phi(\alpha_k) \phi(a_i^k) = \sum_{k=0}^n \alpha_k \phi(a_i)^k = f(\phi(a_i)) \end{aligned}$$

which implies that we can define an automorphism on L by simply mapping a_i to any of the roots of f and keeping the coefficients from K in place. This gives us with at least n such permutations of roots.

ZADANIE 7.

Assume that $K_1 \subseteq K_2 \subseteq K_3 \subseteq \dots$ is an ascending sequence of fields. Verify in detail that $\bigcup K_n$ is also a field, containing K_1, K_2, \dots as subfields.

1. Group under addition:

Let $x, y \in K$, then $x, y \in K_i$ and so $x + y \in K_i$, $-x \in K_i$, $-y \in K_i$ because K_i is a field. Therefore, $x + y, -x \in K$.

2. Group under multiplication:

Let $x, y \in K$ then $x, y \in K_i$ and so $xy \in K_i$ and $x^{-1} \in K_i$. Therefore, $xy \in K$ and $x^{-1} \in K$.

3. Identity element & the zero:

I guess it boils down to showing that if $K \subseteq L$ are fields, then $1_K = 1_L$. Consider $x^2 - x \in K[X]$. We know that $1_K, 0_K$ are the two solutions in K and $1_L, 0_L$ are the two solutions in L . Therefore $\{1_K, 0_K\} = \{1_L, 0_L\}$. If $1_K = 0_L$, then for any $x \in K \subseteq L$ we would have that $x = 1_K x = 0_L x = 0_L$ and so x would be a zero divisor in L which cannot be true.

4. No zero divisors?

Suppose that $x, y \in K \setminus \{0\}$ such that $xy = 0$. But $x, y \in K_i$ and so $xy \in K_i$ and because K_i is a field, then $xy \neq 0$

EXERCISE 8.

Prove that the set $\{\sqrt{p} : p \text{ is a prime number}\}$ is linearly independent over the field \mathbb{Q} .

Consider a polynomial $a_1x_1 + a_2x_2 + \dots + a_nx_n \in \mathbb{Q}[x_1, \dots, x_n]$
